

PSYCON answer interpretation guide

Items A–J Contextual behaviour only; no diagnosis or personality label.

How answers work. A score of 0 does not support the named pattern. A score of 1 records one weak moment. A score of 2 marks a possible one-session pattern that needs more evidence. Scores of 3 or 4 allow the psychologist or model to report the pattern for this session, with timestamps and context. N/O means no conclusion.

Item	Recorded behaviour	Pattern named at 3–4	Evidence the output must include	Context that may change the answer
A	Loses the active discussion thread	Discussion-tracking difficulty	Missed point or change, preceding speech, response, and timestamp	Overlap, poor audio, interrupted attention, unclear topic shift
B	Response does not address the preceding point	Response-alignment difficulty	Prompt or peer point, participant response, and mismatch	Ambiguous prompt, language access, speaker-ID error
C	Does not adjust after the discussion changes	Topic-shift adaptation difficulty	Earlier frame, clear change, later response, and timestamp	Change was subtle, moderator gave conflicting instructions
D	Needs clear spoken information repeated	Spoken-information tracking difficulty	Audible original, repetition, participant response, and opportunity	Distance from microphone, overlap, hearing access
E	Idea order makes the contribution hard to follow	Contribution-organisation difficulty	Contribution sequence and the missing or displaced connection	Transcription error, second-language use, interruption
F	Claim lacks the requested reason or example	Reason-support difficulty	Task requirement, prompt, claim, and missing support	Task did not require support, limited preparation time
G	Stops before completing the central point	Contribution-completion difficulty	Beginning, stopping point, and evidence that no one else caused it	Peer interruption, moderator stopped the turn, recording cut
H	Moves away from the task without a clear link	Task-relevance difficulty	Current topic, new topic, and absence of an explained link	Topic boundary unclear, earlier context outside the clip
I	Starts speaking before a turn is available	Early turn-entry pattern	Active speaker, entry time, overlap length, and outcome	Normal brief overlap, latency, group turn-taking norm
J	Continues overlap after awareness of another speaker	Non-yielding overlap pattern	Evidence of awareness, opportunity to yield, and who continued	Speaker could not hear the overlap, remote audio delay

Output form: “At [time], after [context], participant [observable action]. This supports item [letter] at [score] with [confidence].” Do not replace the evidence with an internal-state explanation.

PSYCON answer interpretation guide

Items K–T Contextual behaviour only; no diagnosis or personality label.

Item	Recorded behaviour	Pattern named at 3–4	Evidence the output must include	Context that may change the answer
K	Holds speaking time after a clear sharing cue	Floor-sharing imbalance	Cue, evidence it was available, continued speech, and effect on others	Cue was unclear, assigned extended turn, moderator error
L	Does not acknowledge a direct peer contribution	Low reciprocal acknowledgement	Direct contribution, fair access, response, and timestamp	No response expected, inaudible speech, language access
M	Behaviour changes sharply after disagreement	Disagreement-linked behavioural change	Same-session behaviour before, disagreement, and observable change	Personal topic, peer hostility, unrelated interruption
N	Changed response continues after the exchange moves on	Slow return to earlier interaction pattern	Trigger, later moments, duration, and participation effect	Discussion remained on the same issue, repeated provocation
O	Participation falls after challenge	Challenge-linked withdrawal pattern	Earlier participation, challenge, later speaking attempts or response length	Turn opportunity disappeared, moderator changed activity
P	Does not revise or clarify after respectful feedback	Feedback-adaptation difficulty	Feedback, evidence it was understood, and later response	Feedback was vague, incorrect, hostile, or interrupted
Q	Speaking rate changes after a pressure event	Pressure-linked speaking-rate change	Same-person baseline, event, direction and duration of change	Different task type, poor segmentation, excited emphasis
R	Pauses or hesitations rise after a pressure event	Pressure-linked hesitation change	Same-person baseline, event, pauses or restarts, and duration	Word search, unfamiliar language, connection delay
S	Vocal delivery changes after a pressure event	Pressure-linked vocal change	Same-person baseline, event, volume, pitch or steadiness change	Microphone movement, automatic gain, background noise
T	Movement or participation changes after a pressure event	Trigger-linked behavioural change	Same-person baseline, event, visible or participation change, and duration	Camera obstruction, seating discomfort, off-screen event

Interpretation rule: These names describe patterns inside one recorded discussion. They do not establish why the pattern occurred, whether it occurs elsewhere, or whether the participant has a psychological condition. Scores Q–T require a same-participant baseline and an identifiable event; otherwise use N/O.
